

POWER BI – WEEK 1 REPORT

NAME: SOWMIYA M

ROLL NUMBER: E25DA040

DATA CLEANING AND TRANSFORMATION USING POWER BI

STEP 1: OPEN POWER BI DESKTOP

Description

Microsoft Power BI Desktop was launched to begin the data preparation and analysis process. The Power BI environment provides different tools for importing, transforming, modeling, and visualizing data.

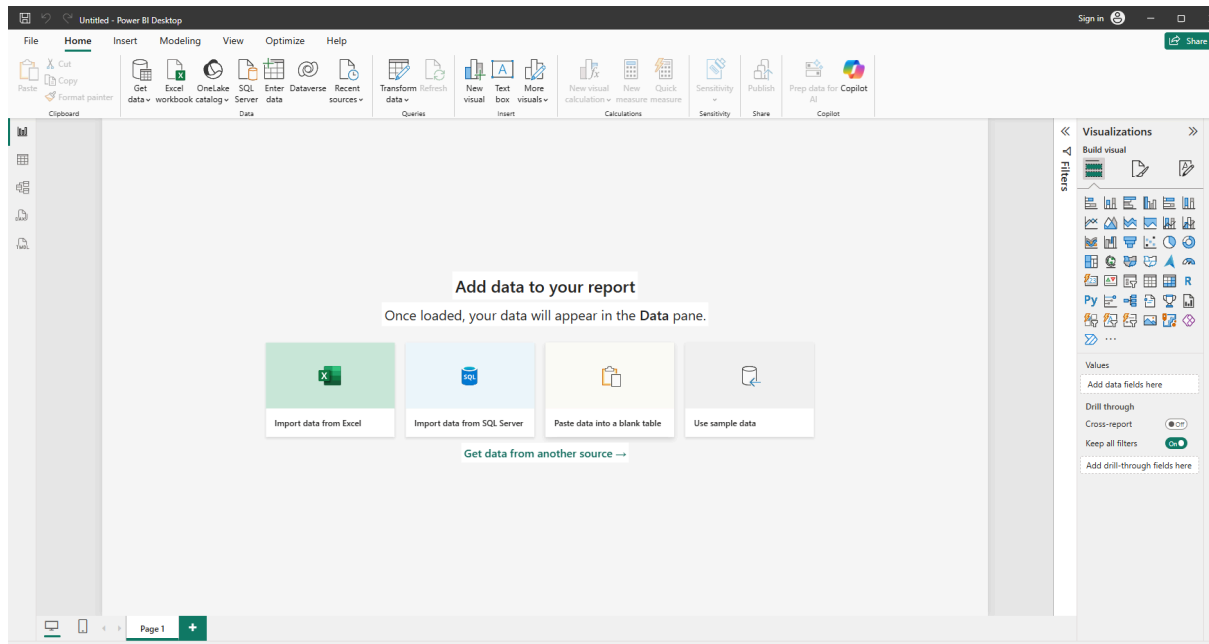

Steps

1. Open **Microsoft Power BI Desktop**.
2. Wait for the Power BI home screen to load.
3. Prepare the application for importing the dataset.

Result

Power BI Desktop was successfully opened and was ready for the data preparation process.

Screenshot:

STEP 2: IMPORT THE SUPERSTORE DATASET

Description

The Superstore Sales dataset was imported into Power BI using the **Text/CSV** option. The **Transform Data** option was selected to open the dataset in Power Query Editor for further cleaning and transformation.

Steps

Home → Get Data → Text/CSV → Select Dataset → Transform Data

Result

The Superstore dataset was successfully loaded into Power Query Editor.

Screenshot:

STEP 3: OPEN POWER QUERY EDITOR

Description

Power Query Editor was used to perform the required data cleaning and transformation activities. It provides different options for changing data types, removing unwanted records, checking data quality, and creating new columns.

Steps

1. Select **Transform Data** after importing the dataset.
2. Open the dataset in Power Query Editor.
3. Review the available columns and data.

Result

The Superstore dataset was opened successfully in Power Query Editor.

STEP 4: CLEAN AND TRIM THE DATA

Description

The dataset was cleaned to improve the consistency and quality of the data. The **Trim** function was used to remove unnecessary spaces from text values. This helps maintain clean and standardized data for further analysis.

Step 1:

1. Select the required text column.
2. Go to the **Transform** tab.
3. Select **Format** → **Trim**.
4. Apply the Trim operation to the required columns.
5. Review the transformed values to ensure that unwanted spaces have been removed.

Result

The selected text data was cleaned by removing unnecessary spaces. The dataset was made more consistent and ready for the next transformation steps.

Step 2:

1. Select the required text column.
2. Go to the **Transform** tab.
3. Select **Format** → **clean**.
4. Apply the Trim operation to the required columns.
5. Review the transformed values to ensure that unwanted spaces have been removed.

Result

Unwanted characters were removed from the selected text fields, resulting in cleaner and more consistent data.

Screenshot:

The screenshot shows the Power Query Editor interface. The 'Transform' tab is active, and the 'Format' menu is open, with the 'Trim' option selected. The formula bar shows the query definition: `= Table.TransformColumns(#"Inserted Day Name",{"Ship Mode", type text, ("Segment", Text.Trim, type text), ("Country/Region", Text.Trim, type text),`. The data table below shows columns: Row ID, Order ID, Order Date, Ship Mode, Customer ID, Customer Name, and Segment. The 'Trim' operation has been applied to the 'Ship Mode', 'Customer ID', 'Customer Name', and 'Segment' columns, as indicated by the 'Clean' status in the column headers. The 'APPLIED STEPS' pane on the right shows the sequence of transformations: Source, Promoted Headers, Changed Type, Changed Type with Locale, Inserted Year, Inserted Day Name, and Trimmed Text.

STEP 5: CHANGE ORDER DATE USING LOCALE

Description

The **Order Date** column was converted into the appropriate date format using the **Using Locale** option. This ensures that Power BI recognizes the values correctly as dates.

Steps

Transform → **Data Type** → **Using Locale** → **Date** → **Select Locale** → **OK**

Result

The Order Date column was successfully converted into the required date format.

Screenshot:

STEP 6: CHANGE SHIP DATE USING LOCALE

Description

The **Ship Date** column was also converted into the appropriate date format. This helps Power BI correctly identify the shipping date values for further analysis.

Steps

Transform → Data Type → Using Locale → Date → Select Locale → OK

Result

The Ship Date column was successfully formatted as a date field.

Screenshot:

STEP 7: CHECK DATA QUALITY

Description

The **Column Quality** feature was used to examine the quality of the dataset. It displays information about valid, error, and empty values present in the columns.

Steps

1. Go to the **View** tab.
2. Select **Column Quality**.
3. Review the quality indicators displayed above the columns.

Result

The dataset was checked for data-quality issues using the Column Quality feature.

Screenshot:

STEP 8: CREATE YEAR COLUMN

Description

A separate **Year** column was created using the Order Date field. This additional column can be used for organizing and analyzing the data based on different years.

Steps

Add Column → Date → Year → Year

Result

A new Year column was successfully added to the dataset.

Screenshot:

The screenshot shows the Power Query Editor interface. The 'Date' menu is open, showing the path: Date > Year > Year. The main data table is visible with columns: Row ID, Order ID, Order Date, Ship Date, Customer ID, Customer Name, and Segment. The 'Year' column has been added to the table, showing values like 2023 for all rows. The 'Query Settings' pane on the right shows the 'Changed Type with Locale' step.

Row ID	Order ID	Order Date	Ship Date	Customer ID	Customer Name	Segment	Year

30	US-2023-162775	13-01-2023		CS-12250	Chris Selesnick	Corporate	2023

STEP 9: CREATE NAME OF DAY COLUMN

Description

A **Name of Day** column was created from the Order Date field. This provides the day name corresponding to each date and can support day-based analysis.

Steps

Add Column → **Date** → **Day** → **Name of Day**

Result

The Name of Day column was successfully created.

Screenshot:

STEP 10: CREATE MONTH AND DAY COLUMNS

Description

The **Order Date** column was used to create additional date-based columns for performing month-to-month and day-to-day analysis. These columns help in understanding sales patterns over different months and days.

The screenshot shows the Power Query Editor interface. The main table has columns: Row ID, Order ID, Order Date, Ship Date, Customer ID, Customer Name, and Segment. The 'Order Date' column is being transformed using the 'Date' menu. The 'Ship Date' column is also visible. The 'Customer ID', 'Customer Name', and 'Segment' columns are also visible. The 'Date' menu is open, showing options like Year, Month, Quarter, Week, Day, etc. The 'Query Settings' pane on the right shows the 'Applied Steps' list, including 'Inserted Month'.

STEP 10: REVIEW THE TRANSFORMED DATA

Description

After completing the required transformations, the dataset was reviewed to ensure that the changes had been applied correctly.

The following transformations were completed:

- Order Date formatting
- Ship Date formatting
- Data quality checking
- Duplicate removal
- Year column creation
- Name of Day column creation

Result

The transformed dataset was reviewed before applying the changes.

STEP 11: CLOSE AND APPLY

Description

After completing the data cleaning and transformation process, the **Close & Apply** option was selected. This applied all the transformations and loaded the prepared dataset into Power BI.

Steps

Home → Close & Apply

Result

All the completed transformations were successfully applied to the Power BI dataset.

Screenshot:

The screenshot shows the Power Query Editor interface. The main area displays a table with the following columns: Row ID, Order ID, Order Date, Ship Date, Ship Mode, Customer ID, Customer Name, and Segment. The table contains 30 rows of data. The 'Inserted Day of Week' column is highlighted in the 'APPLIED STEPS' pane on the right. The 'Properties' pane on the right shows the source as 'samplesuperstore'.

CONCLUSION

The Week 1 Power BI data preparation activity was successfully completed. The Superstore dataset was imported and transformed using

Power Query Editor. Date fields were formatted correctly, data quality was reviewed, duplicate records were handled, and additional date-based columns were created.

The cleaned and transformed dataset is now ready for the next stage of the Power BI project, where different visualizations, measures, slicers, and analytical reports can be created.
